

AFTER CARE INSTRUCTIONS FOR BODY TATTOO REMOVAL

- Day of procedure: When you return home, remove bandage and allow air to circulate and dry out the treated area so a scab can form. Treated area must remain DRY, cover with watertight bandage while showering.
(If accidentally exposed to water, blot dry)
NO SOAP! NO SUN! NO WATER!
- If treated area becomes itchy apply A&D or Bacitracin ONLY AROUND the treated area
- DO NOT APPLY ON TREATED AREA! (Do not scratch! Tap on it if you absolutely have to!) If the treated area looks infected, contact your physician within 24 hours.
- A brownish scab will form over the treated area in 7-10 days and fall off. It is important not to pick or pull at the scab; this will increase the risk of scarring and prolong recovery.

IMPORTANT:

- After scab falls off you will begin the aftertreatment of DermRenu
- Apply DermRenu 2-3 times daily for 2-3 weeks on the treated area
- DermRenu will diminish the redness and assist in the skins natural healing process.
- It is very important to not scratch at the treated area during healing process or you may cause scarring.

When to schedule next appointment:

- If the pigment color is not entirely removed at the treated site, the eliminink tattoo removal process may be performed again in 8-12 weeks post initial treatment.
- IMPORTANT: the shiny pink layer on the new skin must disappear before the next treatment can be performed.
- If the treated area needs to be re-tattooed, please wait the approximate 8-12 week time frame to allow the treated area to heal properly.

I have read and understand the above after care instructions. If I have any questions or concerns regarding these instructions I will call the technician or contact her at DanielasCosmetics@gmail.com. I acknowledge that not following these aftercare instructions can affect the outcome and results of my treatment.
